The key to your next project

Gainsborough's 2000 & 3000 series cylinder mortice locks feature a range of functions to suit both aluminium and timber commercial door applications

Design influence of Lock Survey

The Gainsborough 2000 & 3000 series cylinder mortice locks add a new dimension to the Australian market.

Taking the results of a survey where a large proportion of the market preferred features of the Euro cylinder mortice lock, Gainsborough have turned the Lock market upside down.

Both the narrow stile 23.5mm backset, 2000 series and the 60mm backset, 3000 series have the cylinder where it should be.

With the furniture now located above the cylinder, Gainsborough have extended the distance between the furniture and the cylinder, this was also seen as a distinct advantage over the existing Australian cylinder mortice lock.

Lever furniture in particular doesn't interfere with locking or unlocking with the key in the cylinder, thus allowing for ease of operation as found with the Euro type mortice lock.

14mm Latchbolt & Auxillary Deadlatch Bolt ensure positive locking. Even with excessive door gaps.

Through fixing of external Cylinder escutcheons ensures extra security with internal turnbutton assemblies.

Function Lock Case

Australian Made

Designed and manufactured in Australia the Gainsborough 2000 & 3000 series cylinder mortice locks feature a range of functions for any commercial or residential specifications.

Through fixing of cylinder or turn knob escutcheons and greater door gap deadlatching are just some of security features offered with this new range of locks.

Cylinders are oval type and featuring non-handed cams suited to both the 2000 and 3000 series respectively. A dual function cam allows for retraction of the latchbolt and also locking and unlocking of the furniture, in one easy turn of the key.

Function and handing can be switched on site for ease of operation, from combination to vestibule by simply switching a slide contained in the lock mechanism.

Latchbolt and deadlatching auxillary bolt can be altered to suit opening in or outward opening doors on site, simply by twisting both bolts in the direction required.
